Jobs Phase 2 — Features

Required features to complete the project. Organized by area.

---

1. Category Manager Setup

1.1 Create Jobs Category & Subcategories

- Create a new Jobs category in Category Manager
- Create Jobs subcategories (matching legacy Jobs categories)
- Configure subcategory specifications for Jobs fields:
  - `specSubCatString`: Employment Type (Full Time, Part Time, Contract, Temporary, Internship, Seasonal)
  - `specSubCatString`: Education Level (None, High School, 2 Year Degree, 4 Year Degree, Advanced Degree)
  - `specSubCatString`: Years of Experience (None, 1-2 Years, 3-4 Years, 5-7 Years, 8-10 Years, >10 Years)
  - `specSubCatString` (multiple slots): Company Perks — each perk as a separate boolean-like select slot (Work remote, Flexible schedule, etc.)

1.2 Feature Flag for Jobs Category

- Add a feature flag in GraphQL that filters the Jobs category out of production responses
- Allow access only when the requesting user's member ID is in the team allowlist
- Flag must be removable for launch

---

2. Elasticsearch & Data Sync

2.1 ES Mapping Updates

- Add ES mappings for top-level Jobs fields:
  - `jobsPayRangeType` (keyword: "hourly" or "salary")
  - `jobsPayFrom` (integer, cents)
  - `jobsPayTo` (integer, cents)
  - `jobsApplicationUrl` (keyword — not filterable, but needed for detail page reads)
- Add "Job" as a valid `marketType` value in the ES index

2.2 Mongo Connector Updates

- Update Mongo connector to sync the new top-level Jobs fields to ES
- Verify specSubCat fields sync automatically via the existing pipeline

---

3. SRP (Search Results Page)

3.1 Backend — SRP Search Service

- Add support for filtering by `marketType=Job` in the SRP search service (already extracted from GraphQL)

- Add custom filter mapping for top-level pay range fields (`jobsPayRangeType` , `jobsPayFrom` , `jobsPayTo`) so they can be used as SRP range filters
- Ensure specSubCat-based filters (employment type, education, experience, perks) flow through the existing AvailableFilters pipeline

3.2 Backend — GraphQL

- Update SRP GraphQL query to include `marketType=Job` as a selectable filter option alongside For Sale, In Search Of, For Rent
- Ensure AvailableFilters returns Jobs-specific specSubCat filters when Jobs category/subcategory is selected
- Include pay range as an available filter with custom handling

3.3 Frontend — SRP (requires frontend resource)

- Add "Jobs" as a selectable listing type (marketType) filter on the SRP
- Display Jobs-specific specSubCat filters when Jobs is selected
- Display pay range filter with custom UI (hourly vs salary toggle + range inputs)
- Implement display rules:
  - Jobs mixed with other listing types → standard grid format
  - Jobs is the only selected category → Jobs list format
  - Jobs + Services selected → standard grid style
- Display logic is entirely frontend — no backend hints needed

---

4. Detail Page

4.1 Backend — Listing Service Expansion

- Expand the Listing Service GET endpoint to return Jobs-specific fields:
  - Top-level: `jobsPayRangeType` , `jobsPayFrom` , `jobsPayTo` , `jobsApplicationUrl`
  - specSubCat fields are already returned as part of the listing specs

4.2 Backend — GraphQL

- Update the GraphQL detail page query to pass through Jobs-specific top-level fields from the Listing Service

4.3 Frontend — Detail Page (requires frontend resource + design input)

- Detail Page is **read-only** (no editing — editing goes through PAL, which is out of scope)
- Render standard fields: Title, Description, Company Name (businessName), Photos, Location, Contact Info
- Render specSubCat fields through existing specs UI: Employment Type, Education Level, Years of Experience, Company Perks
- Render top-level Jobs fields (needs design input):
  - Pay Range display (formatted as hourly rate or annual salary based on `jobsPayRangeType`)
  - Apply button linking to `jobsApplicationUrl`

---

5. MyAccount

5.1 Backend — New Listing Service Endpoints

The following MyAccount actions need new endpoints on the Listing Service:

- **Mark as Sold** — update listing status
- **Mark as Sale Pending** — update listing status
- **Delete (Soft Delete)** — set status to 'deleted' + populate `deletedAt` timestamp
- **Renew** — extend listing expiration

Reactivate uses the existing request activation endpoint.

5.2 Backend — Soft Delete Implementation

- Add `deletedAt` timestamp field to the listing model
- Add 'deleted' as a valid status value
- On soft delete:
  - Set status to 'deleted' and populate `deletedAt`
  - Exclude from ES search results
  - Do not count toward user's active listing limits
  - Stop billing/subscriptions
- On reactivation:
  - User must go through checkout flow to re-pay for any canceled subscriptions
  - Listing must be within user's active listing limits
- Retention period and final purge behavior: **pending Legal input**

5.3 Backend — CX Restore Endpoint

- New endpoint for CX to restore soft-deleted listings (including photos)
- Endpoint contract: **pending CX consultation**

5.4 Frontend — MyAccount (requires frontend resource)

- Display Jobs listings in MyAccount listing view
- Support actions: view, mark as sold, mark as sale pending, delete (soft delete), renew, reactivate
- No inline field editing — editing redirects to PAL (out of scope)

---

6. App Work (2-week estimate — capacity not confirmed)

6.1 App — SRP / Jobs Tab

- When user taps the Jobs tab, auto-select the Jobs category and display subcategory list (same pattern as Services today)
- Remove Jobs from global search

6.2 App — Detail Page

- Modify the unified detail page to render Jobs-specific top-level fields:
  - Pay Range (formatted by type)

- Apply button (applicationUrl)

6.3 App — PAL (scope TBD)

- **Needs clarification:** Confirm with App team whether PAL (posting/editing Jobs on app with hard-coded fields, similar to Cars) is included in the 2-week estimate or out of scope

---

Out of Scope

- Saved Search & Alerts for Jobs (Phase 3)
- Quick Apply / Resume uploads / Virus scanning (Phase 4)
- Full migration of existing Jobs listings (Phase 5)
- Post-A-Listing (PAL) form — web or app editing/posting of Jobs listings
- Replacing the subcategory-driven specs model with semantic key/value filters
- `jobApplicationDeadline` field (marked for removal — TODO verify with team)

Open Blockers

Blocker	Owner	Status
Frontend developer not assigned	PM	Not started
Legal input on soft-delete retention/purge	Legal	Not started
CX consultation on restore tool workflow	CX	Not started
App team capacity confirmation	App	Not confirmed
Figma SRP mockup update	Design	Not started
Detail Page design for top-level Jobs fields	Design	Not started
Analytics measurement plan	Analytics	Not started
